

Do any of your findings surprise you?

One of the findings that surprised me the most was the employment growth rate of some of the occupations in the next 10 years. For instance, I knew that Data Scientists were becoming increasingly relevant in the labor force, however I was fairly surprised by the fact that the projected growth is 36% for this sector. Another interesting growth occupation is Computer Scientist at 21%. It is interesting to see how important technological and analytical skills are becoming when it comes to getting a job. Besides the growth of the different jobs, I consider myself fairly educated on the salaries and work-life balance of all of the jobs on the list because I have researched all these types of jobs before.

Rank the jobs you picked from best to worst, and briefly explain why you did so.

1. Financial Managers
2. Management Consultant
3. Lawyer
4. Data Scientist
5. Financial Analyst
6. Financial Advisor
7. Computer scientists
8. Economists
9. Accountant

My job preferences come down primarily to whether I would enjoy the job and how much money I would be making, especially when I'm younger and don't have as many responsibilities. I think some jobs such as accountants and economists are too monotonous for me. I'm also not too interested in becoming a computer scientist because of the lack of experience I have in coding, as it's not my major or minor. I think becoming some type of financial manager or consultant would be intriguing because you get to meet a lot of new people and travel around the country talking to clients. I also wouldn't mind becoming a lawyer as they pay really well and get to establish a lot of relationships with clients.
